"While first living at Tibaera, I kept records of the amount of game hunted and consumed by the band for a period of 3 months—during August, September, and October, 1941. At this time there were about 50 adults living there, and no meat was being introduced from the outside. During August and most of October I kept the records myself, but during September and the first 8 days of October I was wandering with another group of Indians in the forest, and the records were kept by a Bolivian employee of mine who stayed at Tibaera. The daily amount of meat hunted, by whom secured, and the approximate quentity, i.e., estimated gross weight, were noted. The exact distribution of the meat to each individual was impossible to record, but the distribution outside of the extended family was noted with it occurred. On the basis of the total population, the approximate consumption of meat per individual per day is shown in the following tabulation:

Month (1941)	Meat (in pounds)
August	0.56
September	.53
October	.36

After my return from the forest in early October I was accompanied by 94 more Indians, so that keeping records of the amount of meat hunted and consumed by the entire group became so complicated and time-consuming that I was forced to abandon it.

116, 262, 224, 146, 126

However, the figures above give a rough estimate of the quantities of meat consumed daily by the average Siriono. The noticeable decrease for the month of October was probably due to the fact that the Indians were more active in clearing land—to be planted in the month of November—than in hunting. Although I have no reliable data on meat consumption for the other months of the year, it is probably less during January, February, March, and April than at other times, because of the difficulty of travel during the rainy season.

The figures above represent the amount of meat hunted by the Indians with bows and arrows. The data, of course, are not strictly accurate, because the weight of the meat had to be estimated and the number of people present in camp was not always the same. During this period some hunters would be gone for 3 or 4 days at a time, when it was impossible to keep records of their catch, and on some days perhaps not all of the catch was recorded. But even allowing for a large margin of error, the average Indian probably eats less than a pound of meat per day."

"During August there was no meat in camp for 11 days; in September for 9 days; in October for 12 days. The most persistent hunter was out for 16 of the 31 days in August, 12 of the 30 days in September, and 19 of the 31 days in October. The majority of hunters averaged from 10 to 12 [32] days a month. To be sure, the conditions at Tibaera were not in all respects aboriginal. Informants told me, however, and my observations under aboriginal conditions seem to bear them out, that a man goes hunting on the average of every other day throughout the year. On the odd days he rests, repairs arrows, eats (if he has any food), etc."
